

Roger That.

DISTORTION MKII
Owner's manual

Introduction

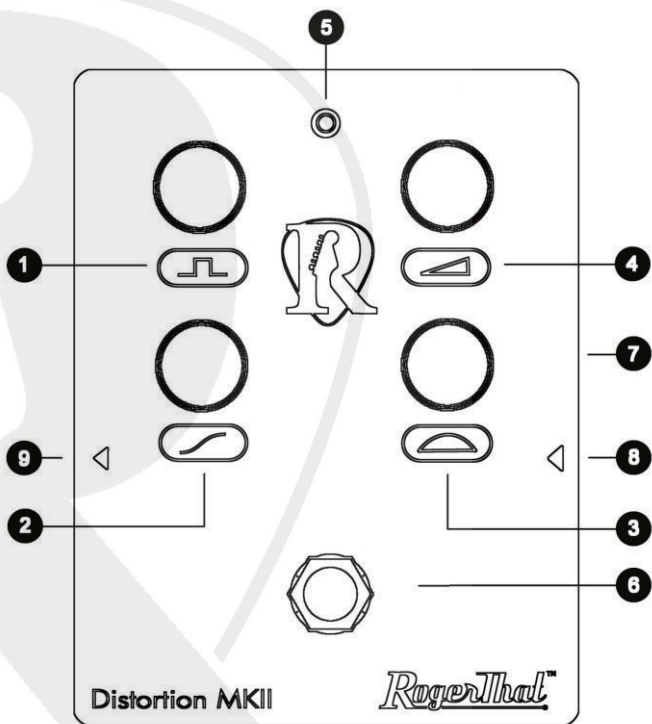

Thank you for purchasing the RogerThat Distortion MKII pedal. This pedal is the result of countless hours of designing and testing in cooperation with experienced musicians and sound engineers.

The RogerThat Distortion MKII pedal is designed to have a clear high gain sound, an aggressive attack, low noise and a wide audio spectrum. Above all, it is a professional Rock/Metal distortion that has the sound of modern leading, high gain tube amplifiers.

The RogerThat Distortion MKII is handmade and assembled with carefully selected and tested high quality components to ensure maximum results concerning reliability and quality, giving an excellent sound. The RogerThat Distortion MKII was built by using multiple stages of JFET clipping, a high pass filter and an OPAMP based BODY BOOST to achieve a wide variety of sounds.

Thanks! The RogerThat team.

Features

1. Gain  Turn clockwise for more gain
2. Tone  Turn clockwise for more high tones
3. Body  Turn clockwise for more low tones
4. Level  Turn clockwise for more volume
5. Led Effect ON/OFF indicator
6. Bypass Switch effect ON/OFF
7. DC Power 9 Volt DC input (reversed polarity)
8. Input Effect INPUT
9. Output Effect OUTPUT

DC Power Input

This pedal runs on 9-18 volts using a standard guitar pedal adapter with a standard barrel plug (2.1 mm x 5.5mm) with the standard guitar pedal polarity as shown below.

Center negative

In order for the pedal to be powered it is essential to connect the INPUT with a ¼" MONO guitar cable.

Specifications

Input impedance= 1MΩ

Output impedance= 100kΩ

Current draw= 12,8mA

DC power input= 9-15V

Warranty

RogerThat products carry a limited 5 year warranty. Warranty is not valid when the PCB or other electronics have been damaged or tampered with or when components have been replaced or damaged while trying to repair them by anybody else than RogerThat™ Electronics.
